installing new piple (people) into your lives

About

pip install is a platform designed to facilitate better networking between students with common interests

Problem statement

Off-campus students **struggle** to meet like-minded peers, find project group mates efficiently, or build communities outside formal housing systems.

Core Features

1. **interest based matching**
2. **Small group chats**
3. **Discover common interests**
4. **Develop communities**

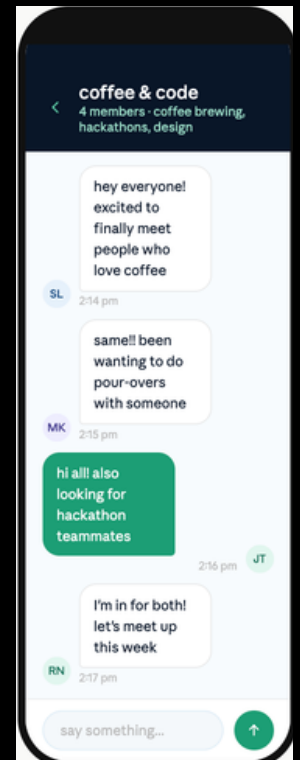

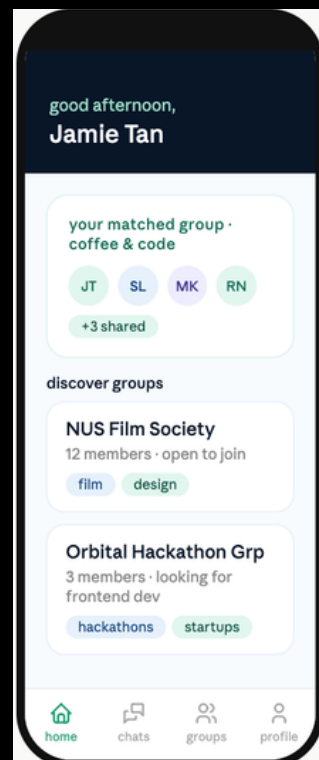

How pip install solves:

pip install **connects** students with similar interests through automatic matching into small group chats, making it **easier to form friendships** and find project teammates without **awkward** outreach.

SWE Practices

pip install follows modular design and API driven development principles, using React to facilitate such design and REST APIs to facilitate a clear separation of concerns

Future Plans

We will collect technical data to streamline the user experience.

We aim to extend the use case by adding additional features to the groups

Find your people faster!!
join **pip install** and start connecting through shared interests today.
